

# ZWZ

## Cement Bearings Catalogue

## Preface

ZWZ fully understands demands and requirements from customers in cement industry. We establish cooperation relationship with cement machinery manufacturers and maintenance team for cement factory, aiming at helping our customers improve properties of machines, reduce stop time of machines and increase productivity. We endeavor to solve problems in production with customers. Deep-groove ball bearings, angular contact ball bearings, cylindrical roller bearings, tapered roller bearings, spherical roller bearings, thrust bearings, etc. we provided are all manufactured with good quality steel and art-to-the-state manufacture techniques. They hold strong steadiness and long service life. Our unified manufacture specifications endure uniform of bearing design and quality. Meanwhile, our professional service team can eliminate your trouble in the first place.

Cement machinery is one of the most challenging

industries for supplying bearings, especially in vertical mills, where the bearings must rotate anti-dusting under low speed, high temperature and insufficient lubrication. In order to conquer those problems, ZWZ carries special design and manufacture to the bearings. We think with the customers' thought and worry customers' trouble by providing excellent service for cement customers with our truly heart.

This pamphlet introduces bearing types and the characteristics common used in cement industry. Customers can select bearings according to property of specific machine. We collect bearing tolerances, clearances and other technical data in the pamphlet for customers' reference. In bearing specification and data chart, we list bearing dimensions, loads, rotation speed and recommended dimensions for installation. For further demands and requirements, you can feel free to contact us.

## Deep groove ball bearing

### Product Characteristics

Deep groove ball bearing consists of four basic parts, which are inner raceway (inner ring), outer raceway (outer ring), steel balls and cage. With normal rotation, inner raceway, outer raceway and steel balls accommodate the load while the cage plays a role in separating the balls and keeping stable. Single-row deep groove ball bearing has a simple structure, non-split inner ring and outer ring and easy to be used so it is widely used bearing in machinery industry such as precision meter, low noise electric motor, automobile, motorcycle, woodworker, transmission shaft of textile machinery, mining machinery, electromechanical equipments, plastic machinery, office equipments, medical equipments, fitness equipments, national defense industry, aeronautic industry, aerospace industry, excise equipments and other general machinery. Single-row deep groove ball bearing is mainly used for accommodating radial load and certain axial load. When this bearing is given a larger

radial clearance, this bearing will have a feature as radial thrust bearing to carry larger axial load and also can limit the axial movement in two directions. Different clearances allow a relative misalignment of inner ring and outer ring ranging from 8' to 16'.

### Product Category:

ZWZ manufactures following kinds of Deep groove ball bearing currently:

Single-row deep groove ball bearing

Single-row deep groove ball bearing with shield(s)

Single-row deep groove ball bearing with seal(s) or shield(s)

Single-row deep groove ball bearing with snap groove or snap ring on outer ring

Single-row deep groove ball bearing is used for the applications without special requirements for mounting, sealing and interface.

Single-row deep groove ball bearing with shield(s) is used for the applications with difficulties in lubricating and checking lubrication or special situations. There is gap between shield(s) and inner ring. Single-row deep groove ball bearing with two shields has been filled with lubricant when manufacturing so it is unnecessary to wash and fill lubricant before mounting. It is also unnecessary to add lubricant within lubricating period during operating.

Single-row deep groove ball bearing with seal(s) has a seal or seals with steel frame. The seal is contact type and has a more superior waterproof property than Single-row deep groove ball bearing with shield(s). However, the rotational speed of this bearing is lower than Single-row deep groove ball bearing with shield(s) due to the larger friction force.

Single-row deep groove ball bearing with snap groove

or snap ring on outer ring simplifies the mounting in housing as a result of positioning with snap ring in axial direction.

### Size range

Basic dimensions for ZWZ deep-groove ball bearing have been listed in dimension data chart.

ID size range: 10mm~1320mm

OD size range: 30mm~1600mm

width size range: 9mm~300 mm

### Tolerance:

The standard tolerance of deep groove ball bearing manufactured by ZWZ is Normal class, which conforms to GB307.1. Please refer to tolerance value please see Table 1~Table 10. Radial bearing (Tapered roller bearing is not included).

Notes: 1) 2.5 is included.

2) Suitable for diameter series 0, 1, 2, 3 and 4 of the open bearings and capped bearings..

3) No suitable for bearings with flanged outer ring.

4) Only applicable for deep groove ball bearings.

## Radial Clearance

The standard internal clearances of deep groove ball bearing manufactured by ZWZ are C2, Standard (CN), C3, C4 AND C5, which conforms to GB4604. The values are available for the bearings before mounting or without load. The bearing with internal clearance large or lower than standard values also can be produced based on users' requirements.

## Angular contact ball bearings

### Product Characteristics

Single-row angular contact ball bearing consists of outer ring, inner ring, one-row balls and cage. This bearing can carry radial load and axial load simultaneously, even pure axial load operating with higher rotational speed. However, single row angular contact ball bearing only can carry axial load in one direction. When this bearing carry radial load, an additional axial force will occur and only can limit the axial movement of shaft and housing in one direction. Although this bearing only can carry axial load in one direction, yet it can be mounted with the other bearing carrying a load in contrary direction. If paired mounting, make the end faces of outer rings of two bearings face to face, i.e. wide end face to wide end face (DB type) and narrow end face to narrow end face (DF type). This arrangement can avoid the occurrence of additional axial force and limit the movement of shaft and housing within axial end play of bearing in two directions.

Single-row angular contact ball bearing has more balls than deep groove ball bearing with the same boundary dimensions and therefore this kind of bearing has the highest load rating among ball bearings, strong rigidity and operates steadily. The radial clearance can be adjusted by the relative movement of inner ring and outer ring. The rigidity of system can be improved by the pre-interference amount generated by placing several bearings face to face or back to back arrangement. Angular contact ball bearing can not be separated and has poor self-aligning property.

The contact angle of this bearing is not zero. The standard contact angle of single-row angular contact ball bearing is 15° , 25° , 30° and 40° . Contact angle determines the radial load and axial load the

bearing can carry. The bigger the contact angle is, the bigger axial load can carry. But the smaller contact angle is beneficial to high speed rotation.

Single-row angular contact ball bearing doesn't have clearance. Internal clearance can only be achieved through stack mounting. According to applications, stack mounting bearings are preloaded or have pre-clearance. The internal clearance of preloaded stack mounting bearings is zero or negative. This bearing is often used on main shaft of machine tool to improve the rigidity and rotational precision of main shaft. The clearance or preload of matched pair angular contact bearing has been set in ZWZ and customer is free to adjust. The width tolerance and end surface convexity of an individual single-row angular contact ball bearing is produced as per normal class so these bearings can not be stack-mounted in random.

ZWZ also can produce universal stack mounting Angular-contact ball bearings with DB, DF or in tandem arrangement. The universal stack mounting bearings have two types, which are preloaded or have pre-clearance. Except universal stack mounting bearings, all individual bearings of other kinds of stack mounting bearings are not interchangeable.

### Product Category

ZWZ can manufacture four types of Angular contact ball bearing:

Single-row angular contact ball bearing  
7000C、7000AC、7000A 、7000B

Stack mounting angular contact ball bearing

Face to Face ( DB ) ; Back to Back ( DF ) ;  
Tandem ( DT ) ; Triplet

Double-row angular contact ball bearing

One inner ring with two-raceway and two outer rings with single raceway

One outer ring with two-raceway and two inner rings with single raceway

One outer ring with two-raceway and one inner ring with two-raceway

Four-point contact ball bearing  
QJ0000、QJF0000

Dimension range:

The basic size of ZWZ angular contact ball bearing has been listed in the dimension data sheet.

Single-row angular contact ball bearing

Dimension range of bore diameter:

25mm-1180mm

Dimension range of outer diameter:

62mm-1420mm

Dimension range of overall width:

16mm-106mm

Matched pair angular contact ball bearing

Dimension range of bore diameter:

30mm-1320mm

Dimension range of outer diameter:

62mm-1600mm

Dimension range of overall width:

32mm-244mm

Double-row angular contact ball Bearing

Dimension range of bore diameter:

35mm-320mm

Dimension range of outer diameter:

72mm-460mm

Dimension range of overall width:

27mm-160mm

Four-point contact ball bearing

Dimension range of bore diameter:

30mm-560mm

Dimension range of outer diameter:

72mm-780mm

Dimension range of overall width:

19mm-90mm

Tolerance:

The standard tolerance of single-row angular contact ball bearing manufactured by P0 class , but ZWZ can also supply the bearings meeting precision Class P6 or higher. For a single bearing with contact angle (  $\alpha$  ) of 15° and 25° used for paired mounting, the precision class meets P5 or above. For a single bearing with contact angle (  $\alpha$  ) of 40° used for paired mounting, the precision class meets P6 or above. ZWZ also can supply the bearings with special precision standard such as 4A , 2A or other precision requirement. The specific standard tolerances please refer to Table 1 to Table 10.

## Cylindrical Roller Bearing

Product characteristic:

Cylindrical rollers linear contact with raceway , radial load capacity improved. Suitable for impact load and heavy load, also applicable for high speed rotation.

After improved design for geometrical shape of cylindrical roller bearing raceway and rollers, the bearing have higher load carrying capacity, new structure designed for ribs and roller surface improved bearing axial load carrying capacity, and further more improve lubrication condition for contact area between roller surface and rib, improve bearing application capacity.

This kind of bearings are mainly used for medium and large size electromotor, electric generator, combustion motor, gas turbine, machine tool spindle, speed reducer, loading/unloading machine, and all kinds of machinery.

Product classification:

ZWZ cylindrical roller bearing can be classified into following series:

- Single row cylindrical roller bearing
- Double row cylindrical roller bearing
- Four row cylindrical roller bearing
- Single row cylindrical roller bearing

NU type, N type

NU type cylindrical roller bearing outer ring has two ribs on the outer ring, the outer ring, rollers and cage can be separated from inner ring. N type cylindrical roller bearing inner ring has two ribs, outer ring, rollers and cage can be separated from inner ring.

NU type and N type cylindrical roller bearing allows axle can move along axial direction in a limited area to the shell, can be used to position changes between shaft and housing that caused by the thermal expansion or

installation error, most suitable for free end bearing. This type of bearings cannot limit axle and housing's axial displacement, can only bear radial load.

NJ type and NF type:

NJ type with two ribs on outer ring , inner ring with single rib.

NJ type and NF type can bear certain direction axial load.

NUP Type, NH Type:

NUP type cylindrical roller bearings have double ribs on the outer ring and single rib and loose rib on inner ring.

NH type cylindrical roller bearings have double ribs on the outer ring, single rib and angular ring on the inner ring. The inner rings and outer rings can be mounted separately (with complete roller and cage assembly).

These bearings can limit the axial movement of shaft and housing in double direction within the bearing axial clearance, besides radial load, this type bearing can carry small amount of axial load in two directions so they can be used on the fixed end bearing. .

NCL—V Type:

Outer ring with no rib, but has double retaining snap ring without cage.

This type with no cage, with larger amount of roller, can bear much more radial load than any other cylindrical roller bearing with same dimensions, but it's limit rotation speed is low. The inner ring and outer ring cannot be separated, and can not be assembled separately, can limit the axial displacement of shaft and housing in double direction within the bearing axial clearance. NB Type:

NB Type bearings has no ribs on inner or outer ring, there are oil lubrication holes on outer rings, inner ring, outer ring and cage with full set of rollers can be assembled separately. It cannot limit axial displacement of bearing

## Cylindrical Roller Bearing

### NJ—V Type:

Cylindrical roller bearing with single rib on the inner ring and without cage

This type have no cage, roller number is more, has better radial load capacity than other cylindrical roller bearings then other cylindrical roller bearing with same dimensions. Limit speed is low, cannot limit axial displacement of shaft or housing, cannot bear axial load.

### NCF—V Type:

Centripetal short cylindrical roller bearing without cage, but outer ring has rib.

This type with no cage, complement rollers, has better radial load capacity than other cylindrical roller bearings with same dimensions. Limit speed is low.

The shaft and the shell of the two directions of the axial displacement limit in bearing axial clearance limit.

### N type(with snap ring groove)

Part of cylindrical roller bearings' outer rings with snap ring groove, with suffix code "N". With snap ring, which can make axial location to bearings in bearing housing. Simplify axial fixture in bore of housing, can make through-hole in housing, to reduce axial dimension of part.

### NJ—V Type:

Cylindrical roller bearing with single rib on the inner ring and without cage

This type have no cage, roller number is more, has better radial load capacity than other cylindrical roller bearings then other cylindrical roller bearing with same dimensions. Limit speed is low, cannot limit axial displacement of shaft or housing, cannot bear axial load.

### NCF—V Type:

Centripetal short cylindrical roller bearing without cage, but outer ring has rib.

This type with no cage, complement rollers, has better radial load capacity than other cylindrical roller bearings with same dimensions. Limit speed is low.

The shaft and the shell of the two directions of the axial displacement limit in bearing axial clearance limit.

### N type(with snap ring groove)

Part of cylindrical roller bearings' outer rings with snap ring groove, with suffix code "N". With snap ring, which can make axial location to bearings in bearing housing. Simplify axial fixture in bore of housing, can make through-hole in housing, to reduce axial dimension of part.

## Tapered roller bearing

### Product Characteristics:

The inner ring and outer ring of taper roller bearings have tapered raceways which are filled with tapered rollers. When extended, the sliding surfaces will converge towards to the same point on the bearing axle. Taper roller bearings can carry combined radial and axial loads and the radial load should be primary. The capacity of carrying axial load varies from the contact angle, the greater the is, the bigger capacity of the bearing have. Taper roller bearings are separable and the cone assembly consists by inner rings, rollers and cages can be installed separably with cup.

This kind of bearings can limit the axial movement of either the shaft or the housing in one direction and not allow the shaft relatively leaning to housing hole. Under the function of radial load, additional axial load will form inside the bearing, so the outer ring and inner ring in the two supportings of bearing should be installed relatively to end faces.

### Product Type:

ZWZ manufactures both metric and inch-sized single-row, double-row and four-row taper roller bearings. Single-row tapered roller bearing

These bearings can only limit the axial displacement of either the shaft or the housing in one direction, and can carry axial load in one direction. When only radial load, the auxiliary axial force can be formed, the axial load shall be balanced which generated internally of the bearing. It is suggested that two of the bearings be put in face-to-face or back-to-back arrangements in application.

### Double-row tapered roller bearing

These taper roller bearing can carry radial load and carries the axial load in double direction simultaneously. It is possible to limit the axial movement of the shaft or the housing in double directions within the scope of the axial load clearance.

### Four-row tapered roller bearing

The functions of these bearings are basically the same as those of the double-row roller bearing. However, they

can carry heavier load than the double-row tapered roller bearings but with slightly slower rotation speed. Applications of these bearings can be found in the heavy machines such as the rolling mills.

Multi-sealed double row or four row tapered roller bearings

ZWZ manufactures double row and four row tapered roller bearings with longer life, multiple seals. Their seal performances are improved by amending traditional design method of full seal bearings, adopting new type seal structure. Comparing to open type bearings, the life of multiple seals double four row tapered bearings can be increased by 20 to 40%, and the lubricating consumption is decreased by 80%.

### Dimension range:

ZWZ taper roller bearing basic dimension has been listed in the dimension data table:

### Single-row tapered roller bearing:

Inner ring dimension range: 20mm~1270mm

Outer ring dimension range: 40mm~1465mm

Width dimension range: 15mm~240 mm

### Double-row tapered roller bearing:

Inner ring dimension range: 38mm~1560mm

Outer ring dimension range: 70mm~1800mm

Width dimension range: 50mm~460 mm

### Four-row tapered roller bearing

Inner ring dimension range: 130mm~1600mm

Outer ring dimension range: 200mm~2000mm

Width dimension range: 150mm~1150 mm

### Tolerance :

ZWZ provides metric-series tapered roller bearing with common tolerance, and also products with P6X、P6、P5、P4、P2 level tolerance. All of tolerances values conform to GB307.1 Standard. The detailed tolerance value is listed in Table 16 - Table 25 .

ZWZ manufactures inch-series tapered roller bearings with normal tolerance class; also manufacture inch-series tapered roller bearings with CL2, CL3, CL10 and CL00 tolerance level.

## Tapered roller bearing

### Radial clearance

ZWZ single-row tapered roller bearings have clearance only after installation, and it is only confirmed after adjusted by another bearing which is located in the opposite direction. The radial clearance of double-row and four-row tapered roller bearing shown in Table 29.

Table 29 Clearance of double-row and four-row tapered roller bearing

## Spherical roller bearing

### Product Characteristic:

Spherical roller bearing have double row spherical roller, outer ring with a common concave type spherical raceway, inner ring with two concave type spherical raceway leans specific angle with bearing axis, the center of curvature of outer raceway is same as the center of the bearing. Spherical roller bearing is self-aligning, so the misalignment of axle & bearing housing or the deformation of axle will not be affected, can compensate the concentricity caused by previous issues. This type of bearing can not only carrying the radial load, but also can carrying double direction axial load, and the combined load, with large load carrying capacity, meanwhile this type of bearing have well vibration and shock resistance ability.

### Product classification:

The spherical roller bearings manufactured by ZWZ can be classified into following types:

Self-aligning roller bearings with cylindrical bore

Self-aligning roller bearings with tapered bore

Self-aligning roller bearings for vibrating riddles

Split self-aligning roller bearing

Self-aligning roller bearing with cylindrical bore

These bearings can be divided into CA and C types according to inner ring (with or without ribs) and cages. The CA type self-aligning roller bearings with two small ribs at the end face of the inner ring, without rib in the middle of the inner ring, Solid cage with double claws integrated structure, material are normally made by brass or carbon steel, this type of material is widely used for large or extra large bearings; C type of self-aligning roller bearings without big or small rib on the end face of inner ring, the roller is "self guided", there is a movable guide ring in the middle of the inner ring, cage is made by

pressed steel, The load ratings of this structure of bearing increased due to longer length of rollers, also this type of bearing have higher limit rotational speed and lower friction consumption.

### Self-aligning roller bearings with tapered bore

The features of self-aligning roller bearings with tapered bore are same as self-aligning roller bearings with cylindrical bore. The difference is that their inner bore is tapered, normally the tapered is 1:12, and is denoted with the suffix K; The tapered 1:30 is applicable for 240 and 241 series, denoted with suffix K30. Self-aligning roller bearing with tapered bore can be mounted directly on conical shaft necks by nuts, and also can be fixed on shafts with cylindrical bore by adapter sleeve or withdrawal sleeve.

### Vibration riddles spherical roller bearings

The new type vibration resistance self-aligning roller bearings are developed by ZWZ especially for vibration machinery. They can be used on universal machinery. They have heavier load carrying capacity, shock resistant capacity, lower friction, lower temperature rise, and longer service life.

These bearings have the same boundary dimension as the basic type, have fixed center ribs on the inner ring, can carry axial load; cage adopts special structure, guided by bore and OD, in double direction, control the guide clearance and the movement with cage, inner ring and outer ring, can prevents from vibration and reduces vibration. The code name of vibration riddles self-aligning roller bearings is denoted with the suffix VB.

## Spherical roller bearing

### Split spherical roller bearings

This type of bearing are mainly used in the applications where it is difficult to touch bearings or separable bearings are used, and the broken down cost is expensive. For example, the cranks.

ZWZ can manufacture different structures of split self-aligning roller bearings according to customer's demands. In order to meet the requirements of mounting, the split inner rings and outer rings are normally adopted. The jamming rings on the two sides of wide inner rings make the mounting easy. The code name of split self-aligning roller bearings is denoted with the suffix D.

### Dimension Scope:

The boundary dimensions of ZWZ spherical roller bearing are listed in the bearing dimensions datasheet.

Bore diameter dimension range: 30mm ~ 1800mm

Outer diameter dimension range: 68mm ~ 2180mm

Width dimension range: 20mm ~ 530mm

### Tolerance

ZWZ manufactures self-aligning roller bearings with P0 and P6 precision grades. ZWZ also can manufacture self-aligning roller bearings with P5 level products according to customer's demands. All the tolerance values conform to GB307.1 standard. All the tolerance values are listed in the previous Table 1~ Table 6

### Radial clearance

ZWZ manufactures self-aligning roller bearings with C2, Standard (CN), C3, C4 and C5 level clearance, which all conform to GB4604 standard. The C3 group clearances are taken as standard clearance for self-aligning roller bearings with tapered bores. The radial clearance values are listed in the Table 30 & 31 the values are adapted to bearings which not mounted and without load applied.

For the bearing over or smaller than the standard clearance, can be manufactured according to customer's demand. The clearance of self-aligning roller bearings applied to vibration riddles is C4 group clearance.

## Thrust ball bearing

### Product characteristics

Thrust ball bearing consists of shaft washer, housing washer, steel balls and cage. The ring matches with shaft called shaft washer, the ring matches with housing called housing washer. If the housing washer's installation surface profile is spherical, then the bearing can be self aligned, which can reduce deviation of installation.

Thrust ball bearing, mainly bear axial loads, and can transfer massive axial loads. It can not bear radial loads. This type bearing mainly applied to steering system of automobile and machine tool spindle.

### product classification

The thrust ball bearing produced by ZWZ can be generally divided into two types:

Single direction thrust ball bearing

Double-direction thrust ball bearing

Single direction thrust ball bearing

Consists of one shaft washer, two housing washers, one center shaft washer, steel balls - cage unit. Bearing can be separated. Shaft washer, housing washers, steel ball - cage unit can be installed individually. These bearings covering 3 types:

Thrust ball bearing with plane housing washer

Thrust ball bearing with self-aligning housing washer

Thrust ball bearing with self-aligning housing washer and

### self-aligning washer

Single direction thrust ball bearing can carry load from single -direction and can make axial location in single -direction.

Double-direction thrust ball bearing

It consists of one shaft washer, two housing washers, a Center washer and ball-cage components. The bearing is detachable and shaft washer, housing washer, ball-cage components can be separately installed. It can be divided into three types:

Thrust ball bearing with plane housing washer

Thrust ball bearing with self-aligning housing washer

Thrust ball bearing with self-aligning housing washer and self-aligning washer

Double-direction thrust ball bearing can carry load from double -direction and positioning axial location in double -direction.

Dimension range

The basic dimension of ZWZ thrust ball bearing has been listed in the table

Inner ring dimension range: 25mm~1380mm

Outer ring dimension range: 42mm~1540mm

Width ring dimension range: 11mm~160 mm

Tolerance

ZWZ standard thrust ball bearings precisions covering

## Thrust Cylindrical Roller Bearings

### Product Characteristics

This type of bearings consists of raceway washers (shaft washer and housing washer) and roller cage unit. Cylindrical rollers are produced with crown profile. Therefore, the pressure is distributed evenly between rollers and raceway surface.

The structure of this type of bearings is separable, bearing shaft washer, housing washer and rolling elements can be assembled separately. When assembled, the axle lines of the shaft and housing are not allowed to be skew.

This type of bearings is for the low rotation speed applications and can bear the axial loads from single direction, can not limit the radial displacements. The axial load capacity is large and the rigidity is also strong.

### Type of bearing

Single direction thrust cylindrical roll bearing

Double direction thrust cylindrical roll bearing

### Dimension range

I.D. range: 30mm~1180mm

O.D. range: 52mm~1400mm

Width diameter range: 16mm~100mm

### Tolerance

The tolerance of such bearings conforms to GB307.4 standard. ZWZ can provide this type of bearings with P0, P6, P5 tolerance. The detailed tolerance please refer to Table 32~ Table 37.

## Thrust Cylindrical Roller Bearings

### Product Characteristics

The tapered rollers (with larger spherical end) of these bearings are guided precisely by the integral flanges of the washers (shaft washer and housing washer) with raceways.

When extended, the design makes the tapered raceway surfaces of the shaft washer and housing washer and the sliding surface of the rollers converge towards to the same single point of the bearing axle line.

Single direction bearings can carry axial load from one direction

Double direction bearings can carry axial load from two directions

The middle washer of double direction bearings is connected with the shaft, but due to the clearance inside, a sleeve must be used to fix the middle washer in the axial direction.

The thrust tapered roller bearings with housing can avoid dirt entering and roller failing. As without cage, more rollers can be putted in, the bearings can carry bigger axial load, but due to lower limit rotation speed, they can only carry axial load in on direction.

Applications of thrust tapered roller bearings

Single direction bearings: Shaft washer is same as housing washer (all with ribs), suitable for radial direction fixing, are mainly found in crane hooks and rotating platform of oil drillings etc.

Full rollers bearings will be used when axial load is large.

During rotation, little shaft eccentric can be allowed for the bearings with plane housing washer raceway.

Double direction : in the mill roll necks.

### Types of bearing

Single-direction thrust tapered roller bearings

Double-direction thrust tapered roller bearings

Thrust tapered roller bearings with housing

Dimension range

I.D. range: 50mm~670mm

O.D. range: 85mm~900mm

Width Diameter range: 22mm~230mm

### Tolerance

The tolerance of ZWZ thrust tapered roller bearings are standardized in GB307.4. ZWZ can supply bearings with P0, P6 and P5 class. The tolerance dimensions please refer to Table 32~ Table 37.

## Thrust Spherical Roller Bearings

### Product Characteristics

Same as aligning roller bearings, housing washer raceway surface is a spherical one which takes the same point of bearing central axle as the spherical center point. The rollers of these bearings are of spherical shape, therefore they are self-aligning and they are not so sensitive to eccentricity and bending of the shaft.

Different with other thrust bearings, these bearings are featured by the extremely big axial load carrying capacity and meanwhile they can also carry certain radial load, however, the radial load should not exceed 55% of the axial load.

### Types of bearings

Symmetric thrust spherical roller bearings

Asymmetric thrust spherical roller bearings

### Dimension scope

The principal dimensions of ZWZ thrust spherical roller bearings have been listed in dimension table.

I.D. range: 60mm~1120mm

O.D. range: 130mm~1460mm

Width dimension range: 39mm~354 mm

### Tolerance

ZWZ can supply bearings with P0, P6 and P5 class please refer to Table 32~Table 37.
